---

Assograph's mission is the design, development and production of protection systems using eco-compatible materials. A strong orientation towards consumers and the environment, together with continuous research, are the elements that allow Assograph to create innovative solutions for packaging and protecting your products during shipment.

We use our technology to design, develop and patent protection solutions that incorporate an air-chamber system obtained by processing the cardboard, which protects the object by absorbing the kinetic force and the return wave. With the same volume, the level of protection is greater than that of other materials such as expanded polystyrene foam, polyethylene, bubble wrap, cellulose pulp and others.

Assograph's solutions consist entirely of cardboard and are biodegradable and eco-compatible: to demonstrate concern for the environment, communicate new corporate values and reduce disposal costs.

Assograph's protection systems are designed to use a self-assembling system that significantly reduces storage space and assembly time, limiting its overall dimensions during shipment and in production and offering the option of being produced in real-time on the line with equipment that is provided free in bailment.

We will study your product and offer a personalised protection system with excellent quality for the price.
